

No-depth Neovaginoplasty or “Genital Remodeling”

You are receiving this document because you have expressed interest in a no-depth neovaginoplasty, or what we like to refer to as a genital remodeling procedure. This is a surgical procedure to create the most natural-appearing external female genitalia as possible, but without creating a vaginal cavity.

Our surgeons use the same surgical technique as they used in a full neovaginoplasty, but without constructing a vaginal cavity. It is done as a single surgery and the procedure lasts about 4-6 hours. We expect you stay overnight. The procedure includes:

- Orchiectomy (if the patient hasn't already had one)
- Penectomy (removal of the penis)
- Creation of the clitoris and clitoral hood
- Shortening and opening the urethra to use it to line the labia minora
- Creation of labia using scrotal skin

Benefits of genital remodeling include:

- No need to dilate
- No need for pre-operative hair removal
- Less time in the hospital than with full neovaginoplasty

The disadvantage of genital remodeling is the absence of an internal canal.
